
NETCON DOME

OT cybersecurity as a service

Improve your OT security, reinforce reliability and streamline your asset management.

NETCON DOME

OT cybersecurity as a service

FEATURES

24/7 detection, response and recovery

Simple activation

A clear picture of your assets

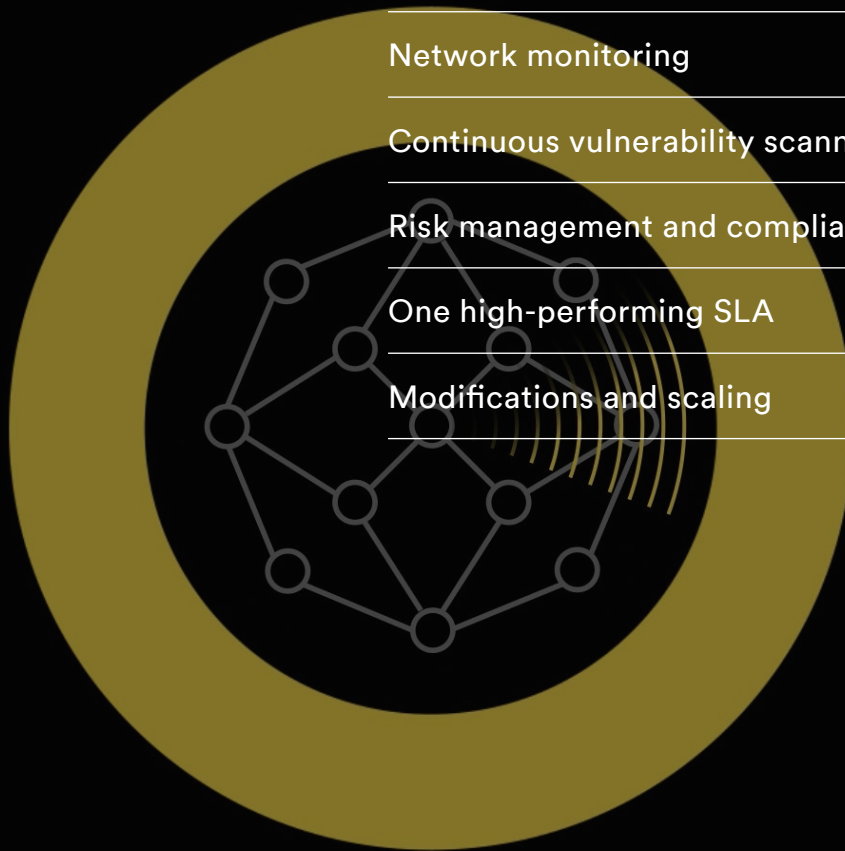

Network monitoring

Continuous vulnerability scanning

Risk management and compliance

One high-performing SLA

Modifications and scaling

Integrated OT cybersecurity service

Do the available cybersecurity operations center (CSOC) services fall short of your requirements for industrial automation? Netcontrol has expanded its managed services into OT-CSOC.

Our Netcon DOME service gives your organization a better visibility into the cybersecurity of your industrial automation system while integrating with your existing IT-based incident-response processes.

MONITORING, DETECTION AND RESPONSE

Netcon DOME monitors your OT environment, detects cybersecurity deviations and responds to them according to your specific SLA with Netcontrol. The service also includes monthly reports and meetings to help you with cybersecurity monitoring and management.

Once activated, DOME gives you a clear view of all the monitored assets in your OT system.

CONTINUOUS SCANNING AND 24/7 CYBERSECURITY CENTER SERVICE

The main task of DOME is to continuously scan your system for vulnerabilities and security

incidents. Upon detecting one, it alerts the experts working at our cybersecurity center – no matter what the time or day.

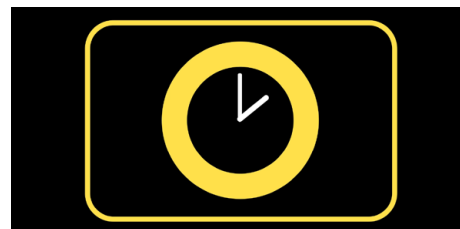

Our experts are trained to understand both the security technology used and your specific OT environment. Having investigated the problem, they will inform your contact person about the situation and, in critical cases, about the corrective actions needed. Thus the problem can be resolved.

The idea is for DOME to be integrated with your existing incident-response workflow as far as possible, not to build parallel procedures.

Fast response

We guarantee a 1-hour response time, from detection to assessment. For high-risk issues, however, we will deliver you a detailed report with recommended actions within 2 hours.

One high-performing SLA to guard your cybersecurity

Certified cybersecurity center within the EU

Netcontrol has the ISO 27001 certification for information security. Our cybersecurity center is located within the European Union.

SERVICE LEVELS AND PRICING

The DOME pricing is according to the service level and the scope of your monitored OT system:

- At the **Base 24/7** and **Base 8/5** levels, pricing is based on the number of monitored nodes (IP addresses).
- DOME **Extended** is priced according to the number of application-based sensor installations (operating systems).
- DOME **Advanced** pricing is based on the number of monitored subnetworks. In addition, an initial fee will be charged for the HW.

This pricing model makes it easy to modify your service level and to scale the service with your OT infrastructure.

NOZOMI NETWORKS TECHNOLOGY, FLEXIBLE IMPLEMENTATION OPTIONS

DOME was designed to work with any kind of OT system you may have. It is based on technology by Nozomi Networks, the world leader in OT cybersecurity for critical infrastructure.

The specific implementation depends on the agreed monitoring level:

- At the **Base** level, commissioning is as simple as installing a virtual appliance with security monitoring capabilities in your virtual environment.
- The **Extended** level adds a separate application that provides detailed information about servers and workstation.
- At the **Advanced** level, additional hardware devices are deployed at key points to provide you with visibility into subnetworks.

NETCON DOME BENEFITS

- Improved OT security
- Reinforced reliability
- Streamlined asset management
- Based on leading OT cybersecurity technology
- Designed to work with any OT network
- Nonintrusive vulnerability scanning
- 24/7 service with skilled resources
- ISO 27001-audited company
- Service produced within EU
